

Coastal Hydrographic and Meteorological Study

Project No. MH-R-2 (Job No. 8)

Rudy Martinez

Abstract

Hydrographic and climatological data collected in the field and taken from publications are presented in this report.

Rainfall was 29 per cent higher in 1966 than in 1965, with heaviest rainfall occurring in May.

Water temperatures followed normal seasonal trends and varied very little from the preceding year. There were no fish kills caused by extreme freezes.

Salinities were generally lower than in 1965 as a result of increased rainfall and influx of fresh water from river discharge.

High tides were experienced in early May with readings of over three feet above mean low tide in most areas. High tides were also experienced in September as a result of the autumnal equinox. An increase in tide, associated with Hurricane Inez, occurred along the lower coast in October.

Habitat modification included routine maintenance dredging in the Galveston and Corpus Christi Ship Channels and in the Upper and Lower Laguna Madre Intra-coastal Waterways, oil well operations, marine development operations, and hurricane protection operations.

Introduction

Coastal Fisheries landings indicate that hydrographic and climatological conditions affect the productivity and abundance of shrimp, crabs and most species of game fish. This project monitors tide, rainfall, runoff, salinity, water temperature, siltation and habitat modifications affecting nursery areas. This report covers sampling from January 1966 to December 1966.

Materials and Methods

Water samples were taken at fixed stations in each bay area on a monthly or semi-monthly basis throughout the period (Figures 1-7). These samples were checked for salinity, turbidity and temperature. Information on precipitation was taken from U. S. Weather Bureau records. River discharge information was obtained from the Water Resources Division of the U. S. Department of Interior, Geological Survey Branch.

Habitat modification of productive nursery area in each bay was determined and any changes or alterations, man-made or natural, were recorded.

esults and Discussions

Rainfall

Coastwide, rainfall totals were 29 per cent higher in 1966 than in 1965. Comparison of 1965 and 1966 rainfall totals by bay area is presented in Table . Heaviest rainfall was recorded in May, with monthly totals ranging from 11.21 inches in Galveston Bay to 6.05 inches in the Lower Laguna Madre (Tables 2 and 3, figures 8 and 9). Spring rains were of sufficient intensity to bring about flooding of most rivers along the coast.

Rainfall was above average during June, July and August. In the Galveston bay area, 6.40 inches fell in August and brought about heavy runoff from rice field drainage into East Bay.

Reduced amounts were recorded at most bay stations in fall. Coastwide rainfall totals were 1.99 inches below 1965 fall readings. In the Matagorda Bay area he recorded 2.76 inches in fall was 6.72 inches less than for the same period n 1965.

December rainfall totals were extremely low, ranging from 0.00 in the San ntonio Bay area to 1.53 inches in the Galveston Bay area. All coastal bay reas south of San Antonio Bay recorded less than one-inch rainfall in December. eavy spring rains and moderate summer rains made up for the reduced amounts in all and winter. Nursery grounds received heavy runoff in May and had extremely ow salinities. This influx of fresh water came at a critical time for juvenile hrimp and probably played a major role in shrimp survival and in the drop in hrimp production in 1966. It also killed many oysters.

River Discharge

River flow measurements were available for six major rivers entering oastal bay areas and are presented in Table 4. Measurements were available rom January through September. There was a general decrease from the upper to lower coast. The Galveston Bay area experienced heavy to moderate flooding from he Trinity-San Jacinto River Basins in May and June. The Galveston Bay area has eceived a historical average of 6.2 million acre-feet annually. The Matagorda ay area received 454,470 acre-feet through the Lavaca-Navidad Rivers, which was 07,400 acre-feet less than in 1965. The San Antonio Bay area experienced looding of the Guadalupe River in early May and in June. This area has re- eived an average of 1.4 million acre-feet annually, but exact measurements were ot available for 1966. The Aransas Bay area received 104,542 acre-feet from anuary through September, which was 62,680 acre-feet more than in 1965. The orpus Christi Bay area received 310,460 acre -feet through the Nueces River rom January through September. This was 41,860 acre -feet less than in 1965. he historic average for the Nueces River is over 610,000 acre-feet annually, ut this flow is virtually eliminated by Wesley Seale Dam before it enters ueces Bay.

Salinity

Salinities were generally lower in 1966 than in 1965 as a result of in- creased rainfall. Salinities in May (Table 2, Figures 8 and 9) were at the low- st levels since 1960 (Tables 5 through 11). Trinity Bay, Upper Galveston Bay, ear Lake and adjacent small bays were virtually fresh in May when highest alinity recorded in Trinity Bay was 4.1 ppt. Matagorda Bay area salinities

ranged from 8.3 ppt to 20.5 ppt with an average of 15.3 ppt during the March-May period. San Antonio Bay area salinities ranged from 0.0 ppt in Guadalupe Bay to 31.6 ppt at Grass Island in Espiritu Santo Bay. The Aransas Bay area ranged from 2.78 ppt to 33.31 ppt with an average of 19.2 ppt. The Corpus Christi Bay area ranged from 5.6 ppt to 32.7 ppt with an average of 28.6 ppt. The Upper Laguna Madre ranged from 33.9 ppt to 46.0 ppt. The Lower Laguna Madre ranged from 22.2 ppt to 39.9 ppt. Salinity samples taken in the Gulf of Mexico in May averaged 25.05 off Port Aransas and 30.03 off Port Mansfield.

Salinity readings in summer were generally lower than in 1965. The lowest reading in the Galveston Bay area was 0.98 ppt in Trinity Bay in June and the highest was 30.07 ppt in West Bay in August. San Antonio Bay salinities ranged from 0.00 ppt in Guadalupe Bay to 29.42 ppt in Big Bayou. Aransas Bay area salinities ranged from 6.66 ppt in Mission Bay in June to 37.20 ppt in Aransas Bay in August. Corpus Christi Bay area salinities ranged from 2.78 ppt in Nueces Bay in June to 33.3 ppt in Corpus Christi Bay in August. The Upper Laguna Madre had an average of 35.90 ppt and the Lower Laguna Madre had an average of 36.66 ppt.

In the fall, reduced amounts of rainfall were recorded at most stations and salinity readings were generally higher than in the summer, but were slightly lower than 1965 readings. Salinities increased slightly in December and the highest average was 43.7 ppt in the Upper Laguna Madre.

Tide Levels

Tide gauge readings were generally low from January through March with readings from 0.3 to 0.6 feet below normal. In April tides returned to normal and continued to increase towards the end of the month. High tides were experienced in early May with recordings of up to 3.6 feet above mean low tide in most areas. Tides dropped to normal in June and July. The upper coast experienced higher tides in August than in June or July. Both the upper and lower coast experienced high tides resulting from the autumnal equinox in September. Tides dropped gradually after October and remained low through December. The lower coast experienced a slight increase in tide in October as a result of Hurricane Inez which hit land below Brownsville.

Water Temperature

Water temperatures were low in all bays during January and February (Table 2, Figures 8 and 9), but there were no fish kills reported from severe freezes. The Galveston Bay area water temperatures ranged from 4.8°C. to 20.0°C. in January. The Matagorda Bay area experienced two freezes, but they were not severe enough to cause damage to marine life. Seadrift area water temperatures dropped to a low of 5.8°C. in January. In February, water temperature ranged from 8.0°C. to 16.3°C. The lower coast water temperatures ranged from 8.0°C. to 19.2°C. in January. Water temperatures increased in all bay areas after March. In summer water temperatures followed normal seasonal trends and average temperatures ranged from 29.2°C. to 31.3°C. Water temperatures decreased after September and continued to decrease steadily through December. There were no fish kills due to freezes during this period.

Habitat Modification

The Galveston Bay area had several areas of modification which includes 1200 feet of shoreline bulkheaded, marsh area drained and Basford Bayou partially locked. In Moses Lake a hurricane wall was finished with a 65-foot gate replacing a one-mile natural opening. Work was started on a Corps of Engineers project which will turn several square miles of marshland into a fresh water impoundment. In West Bay (Lake Como) approximately 30 acres of shallow nursery area were modified by a large basin and 11,000 foot access channel. At Wilson Point (Jones Lake) natural marshland was bulkheaded and filled for a housing development. The Matagorda Bay area had the Palacios Turning Basin redredged and filled with rock mounds and the Palacios Ship Channel deepened and widened. In the San Antonio Bay area modification included the laying of a six-inch pipeline in the Seadrift area near Mosquito Point Reef. An oil well placed in Ayers Bay in June resulted in damage to the bay bottom. Another oil well placed in State tract 178 caused extensive damage when spoil from a 2,500-foot channel covered about 100 acres of prime nursery ground. The Aransas area reported only a few wells in deep water that caused no appreciable damage to nursery ground areas. The Corpus Christi Bay area had several areas of modification which included 30 acres of shallow water area filled to enlarge a recreational area. This area was a popular fishing spot for wade fishermen. The Corpus Christi Ship Channel and Turning Basin were redredged to a depth of 42 feet. An area 500 feet long was bulkheaded at the end of the Jewel Fulton Channel in Ingleside Cove. In Redfish Bay a well was dug in shallow water. Spoil from a channel going to the well was placed in deeper water and damage was minor. In Nueces Bay a 1,200-foot channel was dug for an oil well close to the north shore. The Upper Laguna Madre had approximately 10 acres of nursery ground covered by dredged spoil in the vicinity of the Pure Oil Channel. Maintenance dredging of the Intracoastal Waterway resulted in deposition of spoil that closed three small passes between Marker 31 and Marker 43 where water circulation is already critical. The Lower Laguna Madre had habitat modification which included dredging of an oil well channel near the Willacy and Cameron County line, redredging of the Intracoastal Waterway in Redfish Bay opposite Port Mansfield and dredging at the junction of the Arroyo Colorado which resulted in silting up of several small but important nursery areas.

Comparison of 1965-1966 Rainfall Totals By Area
Rainfall Annual Totals, January-December

	<u>1966</u>	<u>1966</u>	<u>Difference</u>

UNITED STATES
DEPARTMENT OF THE INTERIOR
FISH AND WILDLIFE SERVICE
BUREAU OF COMMERCIAL FISHERIES

COMMERCIAL FISHERIES RESEARCH AND DEVELOPMENT ACT

FINAL (Annual)
QUARTERLY PROGRESS REPORT

State Texas

Sub-Project No. 2-12-R-1

Project Title An Evaluation of the Effects of Estuarine Engineering Projects

Sub-Project Title The Effects of Engineering Projects on Galveston Bay Estuaries

Period Covered April 25, 1966 - March 31, 1967

Prepared By Roy B. Johnson Date May 30, 1967

Approved By Terrance L. Leary Date MAY 31 1967

Statement of Project Accomplishment
(Instructions on reverse side)

The Texas Parks and Wildlife Department has contributed 100 per cent of the project costs and with funds new to the commercial fisheries research. The Bureau of Commercial Fisheries has agreed to reimburse the State for 75 per cent of the cost of the project.

INSTRUCTIONS FOR PREPARATION OF PROGRESS REPORTS

Reimbursement for costs of completed project work will be subject to the submission of satisfactory quarterly progress reports no later than 20 days following the close of a quarter.

Progress reports should be prepared as follows:

- 1. SUB-PROJECT NO.:** Indicate Bureau sub-project number.
- 2. PROJECT AND SUB-PROJECT TITLES:** Titles should correspond with those on other project documents.
- 3. PERIOD COVERED:** Indicate the quarter of the year covered by report.
- 4. PREPARED BY:** Signature and title of principal investigator preparing report. Indicate date of preparation.
- 5. APPROVED BY:** Signatures and title of project leader, coordinator, or other supervisory official. Indicate date of approval.
- 6. ABSTRACT:** Summarize overall project accomplishments during the quarter covered by this report. In addition, indicate any problems encountered, progress in relation to time schedules, and recommendations for future work.
- 7. PHASE PROGRESS:** Progress and accomplishments should be detailed for each phase of a research or development sub-project. Phase titles should correspond to those listed in the PS&E and Notice of Research or Development Project (Form 2-116b). Present complete results of research or development work, indicating procedures and techniques used, and recommendations useful to other researchers. Estimated phase completion dates should be indicated.
- 8. PUBLICATIONS:** List all publications issued or in preparation, indicating titles, authors, publication media, and other pertinent data.

Note: Quarterly reports on construction and coordination projects should adequately summarize progress and accomplishment only, inasmuch as a phase breakdown is not required on project documents.
